Amendments to the Specification

Please replace the paragraph appearing at page 13, lines 1-3 with the following amended paragraph:

FIGURE 4C depicts the isolated DNA coding sequence for the *dnaX* gene (also present in FIGURES <u>4A and 4B</u> 3A and 3B) in accordance with the invention, which corresponds to SEQ. ID. No. 3.

Please replace the paragraph appearing at page 75, lines 7-31 with the following amended paragraph:

The XbaI insert encoded an open reading frame, starting with a GTG codon, of 529 amino acids in length (58.0 kDa), closer to the predicted length of the B. subtilis τ subunit (563 amino acids, 62.7 kDa mass)(Alonso et al., 1990) than the E. coli τ subunit (71.1 kDa)(Yin et al., 1986). The dnaX gene encoding the γ/τ subunits of E. coli DNA polymerase III holoenzyme is homologous to the *holB* gene encoding the δ ' subunit of the γ complex clamp loader, and this homology extends to all 5 subunits of the eukaryotic RFC clamp loader as well as the bacteriophage gene protein 44 of the gp44/62 clamp loading complex (O'Donnell et al., 1993). These gene products show greatest homology over the N-terminal 166 amino acid residues (of E. coli dnaX); the C-terminal regions are more divergent. Fig. 4 shows Figures 5A-B show an alignment of the amino acid sequence of the N-terminal regions of the *T.th. dnaX* gene product to those of several other bacteria. The consensus GXXGXGKT (SEQ. ID. No. 17) motif for nucleotide binding is conserved in all these protein products. Further, the E. coli 8' crystal structure reveals one atom of zinc coordinated to four Cys residues (Guenther, 1996). These four Cys residues are conserved in the E. coli dnaX gene, and the γ and τ subunits encoded by E. coli dnaX bind one atom of zinc. These Cys residues are also conserved in T.th. dnaX (shown in Fig. 4 Figures 5A-B). Overall, the level of amino acid identity relative to E. coli dnaX in the N-terminal 165 residues of T.th. dnaX is 53 %. The T.th. dnaX gene is just as homologous to the B. subtilis dnaX (53 % identity) gene relative to E. coli dnaX. After this region of homology, the C-terminal region of T.th. dnaX shares 26% and 20% identity to E. coli and B. subtilis dnaX, respectively. A proline rich region, downstream of the conserved region, is also present in T.th. dnaX (residues 346-375), but not in the B. subtilis dnaX (see Figs. 3A and 3B). The overall identity between E. coli dnaX and T.th. dnaX over the entire gene is 34%. Identity of T.th. dnaX to B. subtilis dnaX over the entire gene is 28%.
